- Compiled by the South-East Asia regional geologist Ian Longley, this is a GIS Open-File Map collection of over 600 georeferenced geological images.
- Presented in an explorationist-friendly ArcGIS project the true power of technology and knowledge can be released.
- The maps illustrate the tectonic history, palaeogeography and tectonic charge of this under explored region

Also supplied with this collection is Lynx's plug-in for ESRI's ArcGIS: RasterLink. This smart image management tool greatly speeds up the loadtime, processing time and refresh rate of ArcMap by only displaying the raster images when needed by the user and not having all 600+ images loaded initially.

- Supplementary data is also available for to bolt on to this dataset including digital seismic and well data.
- As with all Lynx GIS media, full training, installation and data integration services are offered to clients to enable the full potential to be fully harnessed.
